## "Attempt made to access empty object"
Posted by karrez - 2010/03/31 16:03

_____

i got this message when i tried to create the thiessen polygons during the "write SWAT precipitation" step. i though it might be the same kinda problem people encounter during element parameterization, but i checked and my workspace is in fact set to the location where the datafiles folder is located. any thoughts? attached is a shot of the message.

Another thought, on the computers in my school's GSA lab, the C:drives are "frozen" to prevent permanent problems associated with virus or malware and to prevent students from installing or modifying software; every time a computer is restarted everything on the C:drive is reset to the correct settings. Point being, for this most recent round of modeling I happened to install AGWA on the C:drive, so even though my personal folder where my workspace and datafiles are located is on the un-frozen D:drive is it possible that having the AGWA install file located on a frozen drive is causing me problems? (hope all that makes sense)

Ive had to start over various times on different machines for various reasons, so i am having issues with data structure consistancy. :(
